Conclusion

Lecture topics

- So far we have shown how data representation can be abstracted away
- Building useful containers only once makes it possible to reuse their definition
- Many data structures (tuples, lists, maps, sets, etc.)
 become thus a new layer of abstraction

Introduction

Functions

TEAM INFDFV

Introduction

Problem discussion

General idea

Technical

details Assignments

Conclusion

Lecture topics

- Manipulating these data structures happens in user code
- Often, user code needs to perform operations that are similar to each other
- Similar operations should not require rewriting everything every time

Functions

Adding our own layers

- The goal of this lecture is to add a new layer of abstraction to our programs
- We wish to reuse **implementations**, not only data structures
- This layer of abstraction is called functions

Adding our own layers

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical

details
Assignments

Conclusion

Description

- A function is a collection of instructions and variables
- Some instructions and variables are fixed inside its body
- Other instructions and variables come from outside the function, and thus are not fixed; these are called parameters of the function
- We try to strike the right balance between flexibility and work done
- The function returns a final result that can be recovered by the code that uses the function

Blueprint of a function (NOT ACTUAL PYTHON CODE!)

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical details

Assignments

Conclusion

```
length of a list 1:
    cnt = 0
    x = 1
    while not(x.IsEmpty):
    cnt = cnt + 1
    x = x.Tail
    return cnt as the final result
```

Description

Blueprint of a function (NOT ACTUAL PYTHON CODE!)

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical details

Assignments

Conclusion

```
length of a list 1:
  cnt = 0
  x = 1
  while not(x.IsEmpty):
    cnt = cnt + 1
    x = x.Tail
  return cnt as the final result
```

Description

- length is the function name
- 1 is the only parameter
- Lines 2 through 6 are fixed
- cnt is the final result

General idea

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical

details
Assignments

Conclusion

Using the function

- Code that needs the length of a function can now simply invoke function length
- The resulting code will simply be 1_len = length(1)
- 1_len will be assigned with the value returned by the function

Functions

details
Assignments

Conclusion

Technical details

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical details

Assignments

.....

Conclusion

- A function can be defined in Python quite easily
- The syntax is:
 - def <<name>>(<<pre>parameters>>):ab
 - body
 - return <<result>>
- Inside a function we can put whatever instructions we need
 - if
 - for
 - ...

^aParameters might be none, thus we can write simply ()

^bMultiple parameters are separated by a comma, thus

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical details

Assignments

Conclusion

Using the function

- After we declare a function, we can use it
- The syntax is quite simple
 - <<name>>(<<pre>call the function and
 ignore the result
 - <<v>> = <<name>>(<<parameters>>) to call the
 function and assign the result to the <<v>> variable
- After calling the function, we enter the local environment of the function
- Variables, the PC, etc. are separate from those of the calling site

Conclusion

Syntax and semantics

- We will now describe how Python functions work precisely
 - This is a fundamental bit of knowledge that determines if you really do learn how to program or not
- This absolutely requires a lot of focus to get
- Please panic a bit on the inside

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical details

Assignments

Conclusion

Subtleties that make functions "fun" to use

- About variables
 - Variables and parameters inside a function have precise scope (visibility)
 - Primitive values given as parameters can be changed only locally to the function
 - References given as parameters can be permanently changed from within the function
 - Global variables defined outside the function may be read but not changed from within the function^a
- About behaviour
 - A function may call itself, in a process known as recursion
 - A function may get as parameters and return other functions, in a process known as higher order functions

^aUnless you use some tricks we strongly discourage

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical

details

Assignments

Conclusion

Local and global variables (basics of scope)

- The parameters of a function are added to the list of accessible variables
- They are only visible from inside the function
- Global variables are also visible from inside the function

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical

details

Assignments

Conclusion

Local and global variables (basics of scope)

- Every call to a function generates a new value of the stack memory S
- This contains (private copy of) all local variables
- The heap memory H remains the same
- The original stack memory (the global variables) remains accessible, just read-only

Functions

TEAM INFDEV

Introduction

Problem discussion

General idea

Technical

details
Assignments

Assignments

Conclusion

Local and global variables (basics of scope)

- Every call to a function also reserves some special locations in the stack
- The local PC of the function
- The local variables of the function
- The returned value when the function is done

Conclusion

Recursion

- (Recursive) functions are all functions that call themselves in their bodies
- This is based on the principle of induction and in general a very powerful technique
- This leads to a compacter and often more easily correct representation
 - Code is not easier to read, especially to the untrained eye

Assignments

Conclusion

Recursion

- Remember that calling a function creates a new instance of stack memory
- Recursive functions do this a lot
- Each recursive call has its own environment

Conclusion

Build and test, on paper...

- A function add that increments all elements of a list by a fixed value:
 - add(10, Node(1,Node(2,Node(3,Empty)))) ->
 Node(11,Node(12,Node(13,Empty)))
- A function filterEven that removes all odd elements from a list:
 - filterEven(Node(1,Node(2,Node(3,Empty)))) ->
 Node(2,Empty)
- A function sum that adds all elements of a list:
 - sum(Node(1,Node(2,Node(3,Empty)))) -> 6

Conclusion

Lecture topics

- Often, user code needs to perform operations that are similar to each other
- Through the mechanism of function definition, we can recycle code
- Functions can encode algorithms in many way
 - Simple code abstractions to avoid repetition
 - Recursive problems

This is it!
